1. Out-of-date Version (Apache)

CRITICAL ① 1

Netsparker identified you are using an out-of-date version of Apache.

Impact

Since this is an old version of the software, it may be vulnerable to attacks.

Apache HTTP Server Insufficient Information Vulnerability

modules/arch/win32/mod_isapi.c in mod_isapi in the Apache HTTP Server 2.0.37 through 2.0.63, 2.2.0 through 2.2.14, and 2.3.x before 2.3.7, when running on Windows, does not ensure that request processing is complete before calling isapi_unload for an ISAPI .dll module, which allows remote attackers to execute arbitrary code via unspecified vectors related to a crafted request, a reset packet, and "orphaned callback pointers."

Affected Versions

2.2.6 to 2.2.14

CVSS

AV:N/AC:L/Au:N/C:C/I:C/A:C

External References

• CVE-2010-0425

Apache HTTP Server Improper Authentication Vulnerability

In Apache httpd 2.2.0 to 2.4.29, when generating an HTTP Digest authentication challenge, the nonce sent to prevent reply attacks was not correctly generated using a pseudo-random seed. In a cluster of servers using a common Digest authentication configuration, HTTP requests could be replayed across servers by an attacker without detection.

Affected Versions

2.2.0 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2018-1312

Apache HTTP Server Improper Input Validation Vulnerability

In Apache httpd before 2.2.34 and 2.4.x before 2.4.27, the value placeholder in [Proxy-]Authorization headers of type 'Digest' was not initialized or reset before or between successive key=value assignments by mod_auth_digest. Providing an initial key with no '=' assignment could reflect the stale value of uninitialized pool memory used by the prior request, leading to leakage of potentially confidential information, and a segfault in other cases resulting in denial of service.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:H

• CVE-2017-9788

Apache HTTP Server Improper Restriction of Operations within the Bounds of a Memory Buffer Vulnerability

In Apache httpd 2.2.x before 2.2.33 and 2.4.x before 2.4.26, mod_mime can read one byte past the end of a buffer when sending a malicious Content-Type response header.

Affected Versions

2.2.0 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2017-7679

Apache HTTP Server Numeric Errors Vulnerability

The stream_reqbody_cl function in mod_proxy_http.c in the mod_proxy module in the Apache HTTP Server before 2.3.3, when a reverse proxy is configured, does not properly handle an amount of streamed data that exceeds the Content-Length value, which allows remote attackers to cause a denial of service (CPU consumption) via crafted requests.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:C

External References

• CVE-2009-1890

Apache HTTP Server Resource Management Errors Vulnerability

The mod_deflate module in Apache httpd 2.2.11 and earlier compresses large files until completion even after the associated network connection is closed, which allows remote attackers to cause a denial of service (CPU consumption).

Affected Versions

2.2.6 to 2.2.10

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:C

External References

• CVE-2009-1891

Apache HTTP Server Numeric Errors Vulnerability

The stream_reqbody_cl function in mod_proxy_http.c in the mod_proxy module in the Apache HTTP Server before 2.3.3, when a reverse proxy is configured, does not properly handle an amount of streamed data that exceeds the Content-Length value, which allows remote attackers to cause a denial of service (CPU consumption) via crafted requests.

Affected Versions

2.2.6 to 2.2.11

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:C

CVE-2009-1890

Apache HTTP Server Resource Management Errors Vulnerability

The mod_deflate module in Apache httpd 2.2.11 and earlier compresses large files until completion even after the associated network connection is closed, which allows remote attackers to cause a denial of service (CPU consumption).

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:C

External References

CVE-2009-1891

Apache HTTP Server Resource Management Errors Vulnerability

** DISPUTED ** Unspecified vulnerability in mod_proxy_balancer for Apache HTTP Server 2.2.x before 2.2.7-dev, when running on Windows, allows remote attackers to trigger memory corruption via a long URL. NOTE: the vendor could not reproduce this issue.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:C

External References

• CVE-2007-6423

Apache HTTP Server Resource Management Errors Vulnerability

The byterange filter in the Apache HTTP Server 1.3.x, 2.0.x through 2.0.64, and 2.2.x through 2.2.19 allows remote attackers to cause a denial of service (memory and CPU consumption) via a Range header that expresses multiple overlapping ranges, as exploited in the wild in August 2011, a different vulnerability than CVE-2007-0086.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:C

External References

• CVE-2011-3192

Apache HTTP Server Insufficient Information Vulnerability

mod_session_dbd.c in the mod_session_dbd module in the Apache HTTP Server before 2.4.5 proceeds with save operations for a session without considering the dirty flag and the requirement for a new session ID, which has unspecified impact and remote attack vectors.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:P/I:P/A:P

CVE-2013-2249

Apache HTTP Server Insufficient Information Vulnerability

mod_session_dbd.c in the mod_session_dbd module in the Apache HTTP Server before 2.4.5 proceeds with save operations for a session without considering the dirty flag and the requirement for a new session ID, which has unspecified impact and remote attack vectors.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:P/I:P/A:P

External References

CVE-2013-2249

Apache HTTP Server Out-of-bounds Read Vulnerability

A specially crafted HTTP request header could have crashed the Apache HTTP Server prior to version 2.4.30 due to an out of bound read while preparing data to be cached in shared memory. It could be used as a Denial of Service attack against users of mod_cache_socache. The vulnerability is considered as low risk since mod_cache_socache is not widely used, mod_cache_disk is not concerned by this vulnerability.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:N/I:N/A:H

External References

• CVE-2018-1303

Apache HTTP Server Use After Free Vulnerability

Apache httpd allows remote attackers to read secret data from process memory if the Limit directive can be set in a user's .htaccess file, or if httpd.conf has certain misconfigurations, aka Optionsbleed. This affects the Apache HTTP Server through 2.2.34 and 2.4.x through 2.4.27. The attacker sends an unauthenticated OPTIONS HTTP request when attempting to read secret data. This is a use-after-free issue and thus secret data is not always sent, and the specific data depends on many factors including configuration. Exploitation with .htaccess can be blocked with a patch to the ap_limit_section function in server/core.c.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.1/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:N

External References

• CVE-2017-9798

Apache HTTP Server Improper Access Control Vulnerability

The Apache HTTP Server through 2.4.23 follows RFC 3875 section 4.1.18 and therefore does not protect applications from the presence of untrusted client data in the HTTP_PROXY environment variable, which might allow remote attackers to redirect an application's outbound HTTP traffic to an arbitrary proxy server via a crafted Proxy header in an HTTP request, aka an "httpoxy" issue. NOTE: the vendor states "This mitigation has been assigned the identifier CVE-2016-5387"; in other words, this is not a CVE ID for a vulnerability.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

CVE-2016-5387

Apache HTTP Server Configuration Vulnerability

The Apache HTTP Server 2.2.11 and earlier 2.2 versions does not properly handle Options=IncludesNOEXEC in the AllowOverride directive, which allows local users to gain privileges by configuring (1) Options Includes, (2) Options +Includes, or (3) Options +IncludesNOEXEC in a .htaccess file, and then inserting an exec element in a .shtml file.

Affected Versions

2.2 to 2.2.6

CVSS

AV:L/AC:L/Au:N/C:N/I:N/A:C

External References

• CVE-2009-1195

Apache HTTP Server Configuration Vulnerability

The Apache HTTP Server 2.2.11 and earlier 2.2 versions does not properly handle Options=IncludesNOEXEC in the AllowOverride directive, which allows local users to gain privileges by configuring (1) Options Includes, (2) Options +Includes, or (3) Options +IncludesNOEXEC in a .htaccess file, and then inserting an exec element in a .shtml file.

Affected Versions

2.2.6 to 2.2.10

CVSS

AV:L/AC:L/Au:N/C:N/I:N/A:C

External References

• CVE-2009-1195

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Cross-site scripting (XSS) vulnerability in proxy_ftp.c in the mod_proxy_ftp module in Apache 2.0.63 and earlier, and mod_proxy_ftp.c in the mod_proxy_ftp module in Apache 2.2.9 and earlier 2.2 versions, allows remote attackers to inject arbitrary web script or HTML via a wildcard in the last directory component in the pathname in an FTP URI.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

• CVE-2008-2939

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Cross-site scripting (XSS) vulnerability in the (1) mod_imap module in the Apache HTTP Server 1.3.0 through 1.3.39 and 2.0.35 through 2.0.61 and the (2) mod_imagemap module in the Apache HTTP Server 2.2.0 through 2.2.6 allows remote attackers to inject arbitrary web script or HTML via unspecified vectors.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

• CVE-2007-5000

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Cross-site scripting (XSS) vulnerability in the mod_negotiation module in the Apache HTTP Server 2.2.6 and earlier in the 2.2.x series, 2.0.61 and earlier in the 2.0.x series, and 1.3.39 and earlier in the 1.3.x series allows remote authenticated users to inject arbitrary web script or HTML by uploading a file with a name containing XSS sequences and a file extension, which leads to injection within a (1) "406 Not Acceptable" or (2) "300 Multiple Choices" HTTP response when the extension is omitted in a request for the file.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

CVE-2008-0455

Apache HTTP Server Cross-Site Request Forgery (CSRF) Vulnerability

Cross-site request forgery (CSRF) vulnerability in the balancer-manager in mod_proxy_balancer for Apache HTTP Server 2.2.x allows remote attackers to gain privileges via unspecified vectors.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

CVE-2007-6420

Apache HTTP Server Exposure of Sensitive Information to an Unauthorized Actor Vulnerability

Apache HTTP Server, when running on Linux with a document root on a Windows share mounted using smbfs, allows remote attackers to obtain unprocessed content such as source files for .php programs via a trailing "\" (backslash), which is not handled by the intended AddType directive.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:P/I:N/A:N

External References

CVE-2007-6514

Apache HTTP Server Resource Management Errors Vulnerability

The balancer_handler function in mod_proxy_balancer in the Apache HTTP Server 2.2.0 through 2.2.6, when a threaded Multi-Processing Module is used, allows remote authenticated users to cause a denial of service (child process crash) via an invalid bb variable.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:S/C:N/I:N/A:P

External References

• CVE-2007-6422

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Cross-site scripting (XSS) vulnerability in mod_status in the Apache HTTP Server 2.2.0 through 2.2.6, 2.0.35 through 2.0.61, and 1.3.2 through 1.3.39, when the server-status page is enabled, allows remote attackers to inject arbitrary web script or HTML via unspecified vectors.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

CVE-2007-6388

Apache HTTP Server Other Vulnerability

The mod_proxy_ftp module in the Apache HTTP Server allows remote attackers to bypass intended access restrictions and send arbitrary commands to an FTP server via vectors related to the embedding of these commands in the Authorization HTTP header, as demonstrated by a certain module in VulnDisco Pack Professional 8.11.

Affected Versions

2.2.0 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:P/A:N

External References

• CVE-2009-3095

Apache HTTP Server Numeric Errors Vulnerability

Integer overflow in the ap_pregsub function in server/util.c in the Apache HTTP Server 2.0.x through 2.0.64 and 2.2.x through 2.2.21, when the mod_setenvif module is enabled, allows local users to gain privileges via a .htaccess file with a crafted SetEnvlf directive, in conjunction with a crafted HTTP request header, leading to a heap-based buffer overflow.

Affected Versions

2.2.6

CVSS

AV:L/AC:M/Au:N/C:P/I:P/A:P

External References

• CVE-2011-3607

Apache HTTP Server Improper Input Validation Vulnerability

The mod_proxy module in the Apache HTTP Server 1.3.x through 1.3.42, 2.0.x through 2.0.64, and 2.2.x through 2.2.21 does not properly interact with use of (1) RewriteRule and (2) ProxyPassMatch pattern matches for configuration of a reverse proxy, which allows remote attackers to send requests to intranet servers via a malformed URI containing an initial @ (at sign) character.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:P/I:N/A:N

External References

• CVE-2011-3368

Apache HTTP Server Resource Management Errors Vulnerability

The mod_proxy_ajp module in the Apache HTTP Server before 2.2.21, when used with mod_proxy_balancer in certain configurations, allows remote attackers to cause a denial of service (temporary "error state" in the backend server) via a malformed HTTP request.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2011-3348

Apache HTTP Server Resource Management Errors Vulnerability

The mod_proxy_ajp module in the Apache HTTP Server before 2.2.21, when used with mod_proxy_balancer in certain configurations, allows remote attackers to cause a denial of service (temporary "error state" in the backend server) via a malformed HTTP request.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2011-3348

Apache HTTP Server Resource Management Errors Vulnerability

The Apache HTTP Server 1.x and 2.x allows remote attackers to cause a denial of service (daemon outage) via partial HTTP requests, as demonstrated by Slowloris, related to the lack of the mod_reqtimeout module in versions before 2.2.15.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

CVE-2007-6750

Apache HTTP Server Resource Management Errors Vulnerability

The Apache HTTP Server 1.x and 2.x allows remote attackers to cause a denial of service (daemon outage) via partial HTTP requests, as demonstrated by Slowloris, related to the lack of the mod_reqtimeout module in versions before 2.2.15.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2007-6750

Apache HTTP Server Resource Management Errors Vulnerability

scoreboard.c in the Apache HTTP Server 2.2.21 and earlier might allow local users to cause a denial of service (daemon crash during shutdown) or possibly have unspecified other impact by modifying a certain type field within a scoreboard shared memory segment, leading to an invalid call to the free function.

Affected Versions

2.2 to 2.2.6

CVSS

AV:L/AC:L/Au:N/C:P/I:P/A:P

External References

CVE-2012-0031

Apache HTTP Server Improper Input Validation Vulnerability

The mod_proxy module in the Apache HTTP Server 2.0.x through 2.0.64 and 2.2.x before 2.2.18, when the Revision 1179239 patch is in place, does not properly interact with use of (1) RewriteRule and (2) ProxyPassMatch pattern matches for configuration of a reverse proxy, which allows remote attackers to send requests to intranet servers by using the HTTP/0.9 protocol with a malformed URI containing an initial @ (at sign) character. NOTE: this vulnerability exists because of an incomplete fix for CVE-2011-3368.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

CVE-2011-3639

Apache HTTP Server Improper Input Validation Vulnerability

The mod_proxy module in the Apache HTTP Server 1.3.x through 1.3.42, 2.0.x through 2.0.64, and 2.2.x through 2.2.21, when the Revision 1179239 patch is in place, does not properly interact with use of (1) RewriteRule and (2) ProxyPassMatch pattern matches for configuration of a reverse proxy, which allows remote attackers to send requests to intranet servers via a malformed URI containing an @ (at sign) character and a: (colon) character in invalid positions. NOTE: this vulnerability exists because of an incomplete fix for CVE-2011-3368.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

CVE-2011-4317

Apache HTTP Server Other Vulnerability

The Solaris pollset feature in the Event Port backend in poll/unix/port.c in the Apache Portable Runtime (APR) library before 1.3.9, as used in the Apache HTTP Server before 2.2.14 and other products, does not properly handle errors, which allows remote attackers to cause a denial of service (daemon hang) via unspecified HTTP requests, related to the prefork and event MPMs.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

CVE-2009-2699

Apache HTTP Server Other Vulnerability

The Solaris pollset feature in the Event Port backend in poll/unix/port.c in the Apache Portable Runtime (APR) library before 1.3.9, as used in the Apache HTTP Server before 2.2.14 and other products, does not properly handle errors, which allows remote attackers to cause a denial of service (daemon hang) via unspecified HTTP requests, related to the prefork and event MPMs.

Affected Versions

2.2.6 to 2.2.12

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

CVE-2009-2699

Apache HTTP Server Cryptographic Issues Vulnerability

The TLS protocol, and the SSL protocol 3.0 and possibly earlier, as used in Microsoft Internet Information Services (IIS) 7.0, mod_ssl in the Apache HTTP Server 2.2.14 and earlier, OpenSSL before 0.9.8l, GnuTLS 2.8.5 and earlier, Mozilla Network Security Services (NSS) 3.12.4 and earlier, multiple Cisco products, and other products, does not properly associate renegotiation handshakes with an existing connection, which allows man-in-the-middle attackers to insert data into HTTPS sessions, and possibly other types of sessions protected by TLS or SSL, by sending an unauthenticated request that is processed retroactively by a server in a post-renegotiation context, related to a "plaintext injection" attack, aka the "Project Mogul" issue.

Affected Versions

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:P

External References

• CVE-2009-3555

Apache HTTP Server Resource Management Errors Vulnerability

Stack consumption vulnerability in the fnmatch implementation in apr_fnmatch.c in the Apache Portable Runtime (APR) library before 1.4.3 and the Apache HTTP Server before 2.2.18, and in fnmatch.c in libc in NetBSD 5.1, OpenBSD 4.8, FreeBSD, Apple Mac OS X 10.6, Oracle Solaris 10, and Android, allows context-dependent attackers to cause a denial of service (CPU and memory consumption) via *? sequences in the first argument, as demonstrated by attacks against mod_autoindex in httpd.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2011-0419

Apache HTTP Server Exposure of Sensitive Information to an Unauthorized Actor Vulnerability

The ap_read_request function in server/protocol.c in the Apache HTTP Server 2.2.x before 2.2.15, when a multithreaded MPM is used, does not properly handle headers in subrequests in certain circumstances involving a parent request that has a body, which might allow remote attackers to obtain sensitive information via a crafted request that triggers access to memory locations associated with an earlier request.

Affected Versions

2.2.6

CVSS

CVE-2010-0434

Apache HTTP Server Other Vulnerability

The (1) mod_cache and (2) mod_dav modules in the Apache HTTP Server 2.2.x before 2.2.16 allow remote attackers to cause a denial of service (process crash) via a request that lacks a path.

Affected Versions

2.2.6 to 2.2.15

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2010-1452

Apache HTTP Server Resource Management Errors Vulnerability

Stack consumption vulnerability in the fnmatch implementation in apr_fnmatch.c in the Apache Portable Runtime (APR) library before 1.4.3 and the Apache HTTP Server before 2.2.18, and in fnmatch.c in libc in NetBSD 5.1, OpenBSD 4.8, FreeBSD, Apple Mac OS X 10.6, Oracle Solaris 10, and Android, allows context-dependent attackers to cause a denial of service (CPU and memory consumption) via *? sequences in the first argument, as demonstrated by attacks against mod_autoindex in httpd.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2011-0419

Apache HTTP Server Other Vulnerability

The ap_proxy_ajp_request function in mod_proxy_ajp.c in mod_proxy_ajp in the Apache HTTP Server 2.2.x before 2.2.15 does not properly handle certain situations in which a client sends no request body, which allows remote attackers to cause a denial of service (backend server outage) via a crafted request, related to use of a 500 error code instead of the appropriate 400 error code.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2010-0408

Apache HTTP Server Resource Management Errors Vulnerability

scoreboard.c in the Apache HTTP Server 2.2.21 and earlier might allow local users to cause a denial of service (daemon crash during shutdown) or possibly have unspecified other impact by modifying a certain type field within a scoreboard shared memory segment, leading to an invalid call to the free function.

Affected Versions

2.2.6

CVSS

AV:L/AC:L/Au:N/C:P/I:P/A:P

External References

• CVE-2012-0031

Apache HTTP Server Improper Input Validation Vulnerability

The log_cookie function in mod_log_config.c in the mod_log_config module in the Apache HTTP Server before 2.4.8 allows remote attackers to cause a denial of service (segmentation fault and daemon crash) via a crafted cookie that is not properly handled during truncation.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

• CVE-2014-0098

Apache HTTP Server Improper Input Validation Vulnerability

The log_cookie function in mod_log_config.c in the mod_log_config module in the Apache HTTP Server before 2.4.8 allows remote attackers to cause a denial of service (segmentation fault and daemon crash) via a crafted cookie that is not properly handled during truncation.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2014-0098

Apache HTTP Server Improper Input Validation Vulnerability

The dav_xml_get_cdata function in main/util.c in the mod_dav module in the Apache HTTP Server before 2.4.8 does not properly remove whitespace characters from CDATA sections, which allows remote attackers to cause a denial of service (daemon crash) via a crafted DAV WRITE request.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2013-6438

Apache HTTP Server Improper Input Validation Vulnerability

The dav_xml_get_cdata function in main/util.c in the mod_dav module in the Apache HTTP Server before 2.4.8 does not properly remove whitespace characters from CDATA sections, which allows remote attackers to cause a denial of service (daemon crash) via a crafted DAV WRITE request.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2013-6438

Apache HTTP Server Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') Vulnerability

Race condition in the mod_status module in the Apache HTTP Server before 2.4.10 allows remote attackers to cause a denial of service (heap-based buffer overflow), or possibly obtain sensitive credential information or execute arbitrary code, via a crafted request that triggers improper scoreboard handling within the status_handler function in modules/generators/mod_status.c and the lua_ap_scoreboard_worker function in modules/lua/lua_request.c.

Affected Versions

CVSS

AV:N/AC:M/Au:N/C:P/I:P/A:P

External References

CVE-2014-0226

Apache HTTP Server Resource Management Errors Vulnerability

The mod_cgid module in the Apache HTTP Server before 2.4.10 does not have a timeout mechanism, which allows remote attackers to cause a denial of service (process hang) via a request to a CGI script that does not read from its stdin file descriptor.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2014-0231

Apache HTTP Server Resource Management Errors Vulnerability

The deflate_in_filter function in mod_deflate.c in the mod_deflate module in the Apache HTTP Server before 2.4.10, when request body decompression is enabled, allows remote attackers to cause a denial of service (resource consumption) via crafted request data that decompresses to a much larger size.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2014-0118

Apache HTTP Server Permissions, Privileges, and Access Controls Vulnerability

envvars (aka envvars-std) in the Apache HTTP Server before 2.4.2 places a zero-length directory name in the LD_LIBRARY_PATH, which allows local users to gain privileges via a Trojan horse DSO in the current working directory during execution of apachectl.

Affected Versions

2.2.6

CVSS

AV:L/AC:M/Au:N/C:C/I:C/A:C

External References

CVE-2012-0883

Apache HTTP Server Permissions, Privileges, and Access Controls Vulnerability

protocol.c in the Apache HTTP Server 2.2.x through 2.2.21 does not properly restrict header information during construction of Bad Request (aka 400) error documents, which allows remote attackers to obtain the values of HTTPOnly cookies via vectors involving a (1) long or (2) malformed header in conjunction with crafted web script.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:P/I:N/A:N

External References

CVE-2012-0053

Apache HTTP Server Permissions, Privileges, and Access Controls Vulnerability

envvars (aka envvars-std) in the Apache HTTP Server before 2.4.2 places a zero-length directory name in the LD_LIBRARY_PATH, which allows local users to gain privileges via a Trojan horse DSO in the current working directory during execution of apachectl.

Affected Versions

2.2 to 2.2.6

CVSS

AV:L/AC:M/Au:N/C:C/I:C/A:C

External References

CVE-2012-0883

Apache HTTP Server Permissions, Privileges, and Access Controls Vulnerability

mod_dav.c in the Apache HTTP Server before 2.2.25 does not properly determine whether DAV is enabled for a URI, which allows remote attackers to cause a denial of service (segmentation fault) via a MERGE request in which the URI is configured for handling by the mod dav svn module, but a certain href attribute in XML data refers to a non-DAV URI.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2013-1896

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Multiple cross-site scripting (XSS) vulnerabilities in the Apache HTTP Server 2.2.x before 2.2.24-dev and 2.4.x before 2.4.4 allow remote attackers to inject arbitrary web script or HTML via vectors involving hostnames and URIs in the (1) mod_imagemap, (2) mod_info, (3) mod_ldap, (4) mod_proxy_ftp, and (5) mod_status modules.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

• CVE-2012-3499

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')
Vulnerability

Multiple cross-site scripting (XSS) vulnerabilities in the balancer_handler function in the manager interface in mod_proxy_balancer.c in the mod_proxy_balancer module in the Apache HTTP Server 2.2.x before 2.2.24-dev and 2.4.x before 2.4.4 allow remote attackers to inject arbitrary web script or HTML via a crafted string.

Affected Versions

2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:N

External References

• CVE-2012-4558

Apache HTTP Server Cryptographic Issues Vulnerability

mod_rewrite.c in the mod_rewrite module in the Apache HTTP Server 2.2.x before 2.2.25 writes data to a log file without sanitizing non-printable characters, which might allow remote attackers to execute arbitrary commands via an HTTP request containing an escape sequence for a terminal emulator.

Affected Versions

2.2.6

CVSS

AV:N/AC:H/Au:N/C:P/I:P/A:P

External References

• CVE-2013-1862

Apache HTTP Server Permissions, Privileges, and Access Controls Vulnerability

mod_dav.c in the Apache HTTP Server before 2.2.25 does not properly determine whether DAV is enabled for a URI, which allows remote attackers to cause a denial of service (segmentation fault) via a MERGE request in which the URI is configured for handling by the mod_dav_svn module, but a certain href attribute in XML data refers to a non-DAV URI.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

• CVE-2013-1896

Apache HTTP Server DEPRECATED: Code Vulnerability

The chunked transfer coding implementation in the Apache HTTP Server before 2.4.14 does not properly parse chunk headers, which allows remote attackers to conduct HTTP request smuggling attacks via a crafted request, related to mishandling of large chunk-size values and invalid chunk-extension characters in modules/http/http_filters.c.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:P/A:N

External References

CVE-2015-3183

Apache HTTP Server Improper Input Validation Vulnerability

The lua_websocket_read function in lua_request.c in the mod_lua module in the Apache HTTP Server through 2.4.12 allows remote attackers to cause a denial of service (child-process crash) by sending a crafted WebSocket Ping frame after a Lua script has called the wsupgrade function.

Affected Versions

2.2 to 2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2015-0228

Apache HTTP Server Resource Management Errors Vulnerability

The mod_cgid module in the Apache HTTP Server before 2.4.10 does not have a timeout mechanism, which allows remote attackers to cause a denial of service (process hang) via a request to a CGI script that does not read from its stdin file descriptor.

Affected Versions

2.2.6

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

CVE-2014-0231

Apache HTTP Server NULL Pointer Dereference Vulnerability

When an HTTP/2 stream was destroyed after being handled, the Apache HTTP Server prior to version 2.4.30 could have written a NULL pointer potentially to an already freed memory. The memory pools maintained by the server make this vulnerability hard to trigger in usual configurations, the reporter and the team could not reproduce it outside debug builds, so it is classified as low risk.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:N/I:N/A:H

External References

CVE-2018-1302

Apache HTTP Server Improper Neutralization of CRLF Sequences ('CRLF Injection') Vulnerability

Possible CRLF injection allowing HTTP response splitting attacks for sites which use mod_userdir. This issue was mitigated by changes made in 2.4.25 and 2.2.32 which prohibit CR or LF injection into the "Location" or other outbound header key or value. Fixed in Apache HTTP Server 2.4.25 (Affected 2.4.1-2.4.23). Fixed in Apache HTTP Server 2.2.32 (Affected 2.2.0-2.2.31).

Affected Versions

2.2.6

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:R/S:C/C:L/I:L/A:N

• CVE-2016-4975

Apache HTTP Server Improper Restriction of Operations within the Bounds of a Memory Buffer Vulnerability

A specially crafted request could have crashed the Apache HTTP Server prior to version 2.4.30, due to an out of bound access after a size limit is reached by reading the HTTP header. This vulnerability is considered very hard if not impossible to trigger in non-debug mode (both log and build level), so it is classified as low risk for common server usage.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:N/I:N/A:H

External References

• CVE-2018-1301

Apache HTTP Server Improper Input Validation Vulnerability

Apache HTTP Server mod_cluster before version httpd 2.4.23 is vulnerable to an Improper Input Validation in the protocol parsing logic in the load balancer resulting in a Segmentation Fault in the serving httpd process.

Affected Versions

2.2 to 2.2.6

CVSS

CVSS:3.0/AV:A/AC:L/PR:N/UI:N/S:U/C:N/I:N/A:L

External References

• CVE-2016-8612

Apache HTTP Server Improper Control of Generation of Code ('Code Injection') Vulnerability

CRLF injection vulnerability in the mod_negotiation module in the Apache HTTP Server 2.2.6 and earlier in the 2.2.x series, 2.0.61 and earlier in the 2.0.x series, and 1.3.39 and earlier in the 1.3.x series allows remote authenticated users to inject arbitrary HTTP headers and conduct HTTP response splitting attacks by uploading a file with a multi-line name containing HTTP header sequences and a file extension, which leads to injection within a (1) "406 Not Acceptable" or (2) "300 Multiple Choices" HTTP response when the extension is omitted in a request for the file.

Affected Versions

2.2.0 to 2.2.6

CVSS

AV:N/AC:H/Au:N/C:N/I:P/A:N

External References

CVE-2008-0456

Apache HTTP Server Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

Cross-site scripting (XSS) vulnerability in balancer-manager in mod_proxy_balancer in the Apache HTTP Server 2.2.0 through 2.2.6 allows remote attackers to inject arbitrary web script or HTML via the (1) ss, (2) wr, or (3) rr parameters, or (4) the URL.

Affected Versions

CVSS

AV:N/AC:M/Au:S/C:N/I:P/A:N

External References

CVE-2007-6421

Apache HTTP Server Improper Input Validation Vulnerability

The ap_pregsub function in server/util.c in the Apache HTTP Server 2.0.x through 2.0.64 and 2.2.x through 2.2.21, when the mod_setenvif module is enabled, does not restrict the size of values of environment variables, which allows local users to cause a denial of service (memory consumption or NULL pointer dereference) via a .htaccess file with a crafted SetEnvlf directive, in conjunction with a crafted HTTP request header, related to (1) the "len +=" statement and (2) the apr_pcalloc function call, a different vulnerability than CVE-2011-3607.

• CVE-2014-3567

OpenSSL Resource Management Errors Vulnerability

The asn1_d2i_read_bio function in crypto/asn1/a_d2i_fp.c in the ASN.1 BIO implementation in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2h allows remote attackers to cause a denial of service (memory consumption) via a short invalid encoding.

Affected Versions

0.9.2b to 0.9.8zh

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:N/I:N/A:H

External References

• CVE-2016-2109

OpenSSL Improper Restriction of Operations within the Bounds of a Memory Buffer Vulnerability

The X509_NAME_oneline function in crypto/x509/x509_obj.c in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2h allows remote attackers to obtain sensitive information from process stack memory or cause a denial of service (buffer over-read) via crafted EBCDIC ASN.1 data.

Affected Versions

0.9.2b to 0.9.8zh

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:H

External References

• CVE-2016-2176

Integer overflow in the EVP_EncryptUpdate function in crypto/evp/evp_enc.c in OpenSSL before 1.0.1t and 1.0.2 before 1.0.2h allows remote attackers to cause a denial of service (heap memory corruption) via a large amount of data.

Affected Versions

0.9.2b to 0.9.8zh

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:N/I:N/A:H

External References

• CVE-2016-2106

OpenSSL Resource Management Errors Vulnerability

Memory leak in the zlib_stateful_finish function in crypto/comp/c_zlib.c in OpenSSL 0.9.8l and earlier and 1.0.0 Beta through Beta 4 allows remote attackers to cause a denial of service (memory consumption) via vectors that trigger incorrect calls to the CRYPTO_cleanup_all_ex_data function, as demonstrated by use of SSLv3 and PHP with the Apache HTTP Server, a related issue to CVE-2008-1678.

Affected Versions

0.9.2b to 0.9.8l

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

CVE-2009-4355

OpenSSL Cryptographic Issues Vulnerability

The TLS protocol, and the SSL protocol 3.0 and possibly earlier, as used in Microsoft Internet Information Services (IIS) 7.0, mod_ssl in the Apache HTTP Server 2.2.14 and earlier, OpenSSL before 0.9.8l, GnuTLS 2.8.5 and earlier, Mozilla Network Security Services (NSS) 3.12.4 and earlier, multiple Cisco products, and other products, does not properly associate renegotiation handshakes with an existing connection, which allows man-in-the-middle attackers to insert data into HTTPS sessions, and possibly other types of sessions protected by TLS or SSL, by sending an unauthenticated request that is processed retroactively by a server in a post-renegotiation context, related to a "plaintext injection" attack, aka the "Project Mogul" issue.

Affected Versions

0.9.2b to 0.9.8k

CVSS

AV:N/AC:M/Au:N/C:N/I:P/A:P

External References

CVE-2009-3555

OpenSSL Cryptographic Issues Vulnerability

The Network Security Services (NSS) library before 3.12.3, as used in Firefox; GnuTLS before 2.6.4 and 2.7.4; OpenSSL 0.9.8 through 0.9.8k; and other products support MD2 with X.509 certificates, which might allow remote attackers to spoof certificates by using MD2 design flaws to generate a hash collision in less than brute-force time. NOTE: the scope of this issue is currently limited because the amount of computation required is still large.

Affected Versions

0.9.8 to 0.9.8k

CVSS

AV:N/AC:H/Au:N/C:P/I:P/A:P

External References

CVE-2009-2409

OpenSSL Improper Authentication Vulnerability

Mutt 1.5.19, when linked against (1) OpenSSL (mutt_ssl.c) or (2) GnuTLS (mutt_ssl_gnutls.c), allows connections when only one TLS certificate in the chain is accepted instead of verifying the entire chain, which allows remote attackers to spoof trusted servers via a man-in-the-middle attack.

Affected Versions

0.9.2b to 0.9.8zh

CVSS

AV:N/AC:M/Au:N/C:P/I:P/A:P

External References

• CVE-2009-1390

OpenSSL Resource Management Errors Vulnerability

The dtls1_retrieve_buffered_fragment function in ssl/d1_both.c in OpenSSL before 1.0.0 Beta 2 allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via an out-of-sequence DTLS handshake message, related to a "fragment bug."

Affected Versions

0.9.7a to 0.9.8k

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2009-1387

OpenSSL Other Vulnerability

ssl/s3_pkt.c in OpenSSL before 0.9.8i allows remote attackers to cause a denial of service (NULL pointer dereference and daemon crash) via a DTLS ChangeCipherSpec packet that occurs before ClientHello.

Affected Versions

0.9.7a to 0.9.8h

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

• CVE-2015-3195

OpenSSL Resource Management Errors Vulnerability

The BN_GF2m_mod_inv function in crypto/bn/bn_gf2m.c in OpenSSL before 0.9.8s, 1.0.0 before 1.0.0e, 1.0.1 before 1.0.1n, and 1.0.2 before 1.0.2b does not properly handle ECParameters structures in which the curve is over a malformed binary polynomial field, which allows remote attackers to cause a denial of service (infinite loop) via a session that uses an Elliptic Curve algorithm, as demonstrated by an attack against a server that supports client authentication.

Affected Versions

0.9.2b to 0.9.8zf

CVSS

AV:N/AC:M/Au:N/C:N/I:N/A:P

External References

CVE-2015-1788

OpenSSL Other Vulnerability

The PKCS7_dataDecodefunction in crypto/pkcs7/pk7_doit.c in OpenSSL before 0.9.8zg, 1.0.0 before 1.0.0s, 1.0.1 before 1.0.1n, and 1.0.2 before 1.0.2b allows remote attackers to cause a denial of service (NULL pointer dereference and application crash) via a PKCS#7 blob that uses ASN.1 encoding and lacks inner EncryptedContent data.

Affected Versions

0.9.2b to 0.9.8zf

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2015-1790

OpenSSL Resource Management Errors Vulnerability

The do_free_upto function in crypto/cms/cms_smime.c in OpenSSL before 0.9.8zg, 1.0.0 before 1.0.0s, 1.0.1 before 1.0.1n, and 1.0.2 before 1.0.2b allows remote attackers to cause a denial of service (infinite loop) via vectors that trigger a NULL value of a BIO data structure, as demonstrated by an unrecognized X.660 OID for a hash function.

Affected Versions

0.9.2b to 0.9.8zf

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2015-1792

OpenSSL Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') Vulnerability

Race condition in the ssl3_get_new_session_ticket function in ssl/s3_clnt.c in OpenSSL before 0.9.8zg, 1.0.0 before 1.0.0s, 1.0.1 before 1.0.1n, and 1.0.2 before 1.0.2b, when used for a multi-threaded client, allows remote attackers to cause a denial of service (double free and application crash) or possibly have unspecified other impact by providing a NewSessionTicket during an attempt to reuse a ticket that had been obtained earlier.

Affected Versions

AV:N/AC:M/Au:N/C:P/I:P/A:P

External References

• CVE-2015-1791

OpenSSL Other Vulnerability

Double free vulnerability in d1_both.c in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8zb, 1.0.0 before 1.0.0n, and 1.0.1 before 1.0.1i allows remote attackers to cause a denial of service (application crash) via crafted DTLS packets that trigger an error condition.

Affected Versions

0.9.8 to 0.9.8y

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2014-3505

OpenSSL Resource Management Errors Vulnerability

d1_both.c in the DTLS implementation in OpenSSL 0.9.8 before 0.9.8zb, 1.0.0 before 1.0.0n, and 1.0.1 before 1.0.1i allows remote attackers to cause a denial of service (memory consumption) via crafted DTLS handshake messages that trigger memory allocations corresponding to large length values.

Affected Versions

0.9.8 to 0.9.8y

CVSS

AV:N/AC:L/Au:N/C:N/I:N/A:P

External References

• CVE-2014-3506

OpenSSL Cryptographic Issues Vulnerability

The ssl3_send_client_key_exchange function in s3_clnt.c in OpenSSL before 0.9.8za, 1.0.0 before 1.0.0m, and 1.0.1 before 1.0.1h, when an anonymous ECDH cipher suite is used, allows remote attackers to cause a denial of service (NULL pointer dereference and client crash) by triggering a NULL certificate value.

3. Out-of-date Version (Tomcat)

CRITICAL ① 1

Netsparker identified you are using an out-of-date version of Tomcat.

Apache Tomcat Exposure of Resource to Wrong Sphere Vulnerability

While investigating bug 60718, it was noticed that some calls to application listeners in Apache Tomcat 9.0.0.M1 to 9.0.0.M17, 8.5.0 to 8.5.11, 8.0.0.RC1 to 8.0.41, and 7.0.0 to 7.0.75 did not use the appropriate facade object. When running an untrusted application under a SecurityManager, it was therefore possible for that untrusted application to retain a reference to the request or response object and thereby access and/or modify information associated with another web application.

Affected Versions

7.0.0 to 7.0.75

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:N

External References

• CVE-2017-5648

Apache Tomcat Insecure Default Initialization of Resource Vulnerability

The defaults settings for the CORS filter provided in Apache Tomcat 9.0.0.M1 to 9.0.8, 8.5.0 to 8.5.31, 8.0.0.RC1 to 8.0.52, 7.0.41 to 7.0.88 are insecure and enable 'supportsCredentials' for all origins. It is expected that users of the CORS filter will have configured it appropriately for their environment rather than using it in the default configuration. Therefore, it is expected that most users will not be impacted by this issue.

Affected Versions

7.0.41 to 7.0.88

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2018-8014

Apache Tomcat Improper Access Control Vulnerability

Remote code execution is possible with Apache Tomcat before 6.0.48, 7.x before 7.0.73, 8.x before 8.0.39, 8.5.x before 8.5.7, and 9.x before 9.0.0.M12 if JmxRemoteLifecycleListener is used and an attacker can reach JMX ports. The issue exists because this listener wasn't updated for consistency with the CVE-2016-3427 Oracle patch that affected credential types.

Affected Versions

7.0.0 to 7.0.72

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2016-8735

Apache Tomcat Improper Input Validation Vulnerability

When using the Apache JServ Protocol (AJP), care must be taken when trusting incoming connections to Apache Tomcat. Tomcat treats AJP connections as having higher trust than, for example, a similar HTTP connection. If such connections are available to an attacker, they can be exploited in ways that may be surprising. In Apache Tomcat 9.0.0.M1 to 9.0.0.30, 8.5.0 to 8.5.50 and 7.0.0 to 7.0.99, Tomcat shipped with an AJP Connector enabled by default that listened on all configured IP addresses. It was expected (and recommended in the security guide) that this Connector would be disabled if not required. This vulnerability report identified a mechanism that allowed: - returning arbitrary files from anywhere in the web application - processing any file in the web application as a JSP Further, if the web application allowed file upload and stored those files within the web application (or the attacker was able to control the content of the web application by some other means) then this, along with the ability to process a file as a JSP, made remote code execution possible. It is important to note that mitigation is only required if an AJP port is accessible to untrusted users. Users wishing to take a defence-in-depth approach and block the vector that permits returning arbitrary files and execution as JSP may upgrade to Apache Tomcat 9.0.31, 8.5.51 or 7.0.100 or later. A number of changes were made to the default AJP Connector configuration in 9.0.31 to harden the default configuration. It is likely that users upgrading to 9.0.31, 8.5.51 or 7.0.100 or later will need to make small changes to their configurations.

Affected Versions

7.0.0 to 7.0.99

CVSS

CVE-2020-1938

Apache Tomcat Deserialization of Untrusted Data Vulnerability

The fix for CVE-2020-9484 was incomplete. When using Apache Tomcat 10.0.0-M1 to 10.0.0, 9.0.0.M1 to 9.0.41, 8.5.0 to 8.5.61 or 7.0.0. to 7.0.107 with a configuration edge case that was highly unlikely to be used, the Tomcat instance was still vulnerable to CVE-2020-9494. Note that both the previously published prerequisites for CVE-2020-9484 and the previously published mitigations for CVE-2020-9484 also apply to this issue.

Affected Versions

7.0.0 to 7.0.107

External References

• CVE-2021-25329

Apache Tomcat Unrestricted Upload of File with Dangerous Type Vulnerability

When running Apache Tomcat 7.0.0 to 7.0.79 on Windows with HTTP PUTs enabled (e.g. via setting the readonly initialisation parameter of the Default to false) it was possible to upload a JSP file to the server via a specially crafted request. This JSP could then be requested and any code it contained would be executed by the server.

Affected Versions

7.0.54 to 7.0.77

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2017-12615

Apache Tomcat Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') Vulnerability

When running on Windows with enableCmdLineArguments enabled, the CGI Servlet in Apache Tomcat 9.0.0.M1 to 9.0.17, 8.5.0 to 8.5.39 and 7.0.0 to 7.0.93 is vulnerable to Remote Code Execution due to a bug in the way the JRE passes command line arguments to Windows. The CGI Servlet is disabled by default. The CGI option enableCmdLineArguments is disable by default in Tomcat 9.0.x

(and will be disabled by default in all versions in response to this vulnerability). For a detailed explanation of the JRE behaviour, see Markus Wulftange's blog (https://codewhitesec.blogspot.com/2016/02/java-and-command-line-injections-in-windows.html) and this archived MSDN blog

(https://web.archive.org/web/20161228144344/https://blogs.msdn.microsoft.com/twistylittlepassagesallalike/2011/04/23/everyone-quotes-command-line-arguments-the-wrong-way/).

Affected Versions

7.0.0 to 7.0.93

CVE-2020-8022

Apache Tomcat Unrestricted Upload of File with Dangerous Type Vulnerability

When running Apache Tomcat versions 9.0.0.M1 to 9.0.0, 8.5.0 to 8.5.22, 8.0.0.RC1 to 8.0.46 and 7.0.0 to 7.0.81 with HTTP PUTs enabled (e.g. via setting the readonly initialisation parameter of the Default servlet to false) it was possible to upload a JSP file to the server via a specially crafted request. This JSP could then be requested and any code it contained would be executed by the server.

Affected Versions

7.0.54 to 7.0.77

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:H/A:H

External References

• CVE-2017-12617

Apache Tomcat Improper Handling of Exceptional Conditions Vulnerability

The error page mechanism of the Java Servlet Specification requires that, when an error occurs and an error page is configured for the error that occurred, the original request and response are forwarded to the error page. This means that the request is presented to the error page with the original HTTP method. If the error page is a static file, expected behaviour is to serve content of the file as if processing a GET request, regardless of the actual HTTP method. The Default Servlet in Apache Tomcat 9.0.0.M1 to 9.0.0.M20, 8.5.0 to 8.5.14, 8.0.0.RC1 to 8.0.43 and 7.0.0 to 7.0.77 did not do this. Depending on the original request this could lead to unexpected and undesirable results for static error pages including, if the DefaultServlet is configured to permit writes, the replacement or removal of the custom error page. Notes for other user provided error pages: (1) Unless explicitly coded otherwise, JSPs ignore the HTTP method. JSPs used as error pages must must ensure that they handle any error dispatch as a GET request, regardless of the actual method. (2) By default, the response generated by a Servlet does depend on the HTTP method. Custom Servlets used as error pages must ensure that they handle any error dispatch as a GET request, regardless of the actual method.

Affected Versions

7.0.54 to 7.0.77

• CVE-2018-1336

Apache Tomcat Session Fixation Vulnerability

When using FORM authentication with Apache Tomcat 9.0.0.M1 to 9.0.29, 8.5.0 to 8.5.49 and 7.0.0 to 7.0.98 there was a narrow window where an attacker could perform a session fixation attack. The window was considered too narrow for an exploit to be practical but, erring on the side of caution, this issue has been treated as a security vulnerability.

Affected Versions

7.0.0 to 7.0.98

CVSS

CVSS:3.1/AV:N/AC:H/PR:N/UI:R/S:U/C:H/I:H/A:H

External References

• CVE-2019-17563

Apache Tomcat Insufficiently Protected Credentials Vulnerability

When Apache Tomcat 9.0.0.M1 to 9.0.28, 8.5.0 to 8.5.47, 7.0.0 and 7.0.97 is configured with the JMX Remote Lifecycle Listener, a local attacker without access to the Tomcat process or configuration files is able to manipulate the RMI registry to perform a manin-the-middle attack to capture user names and passwords used to access the JMX interface. The attacker can then use these credentials to access the JMX interface and gain complete control over the Tomcat instance.

Affected Versions

7.0.0 to 7.0.97

CVSS

CVSS:3.1/AV:L/AC:H/PR:L/UI:N/S:U/C:H/I:H/A:H

External References

CVE-2019-12418

Apache Tomcat 7PK - Errors Vulnerability

A bug in the error handling of the send file code for the NIO HTTP connector in Apache Tomcat 9.0.0.M1 to 9.0.0.M13, 8.5.0 to 8.5.8, 8.0.0.RC1 to 8.0.39, 7.0.0 to 7.0.73 and 6.0.16 to 6.0.48 resulted in the current Processor object being added to the Processor cache multiple times. This in turn meant that the same Processor could be used for concurrent requests. Sharing a Processor can result in information leakage between requests including, not not limited to, session ID and the response body. The bug was first noticed in 8.5.x onwards where it appears the refactoring of the Connector code for 8.5.x onwards made it more likely that the bug was observed. Initially it was thought that the 8.5.x refactoring introduced the bug but further investigation has shown that the bug is present in all currently supported Tomcat versions.

Affected Versions

7.0.52 to 7.0.73

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:H/I:N/A:N

External References

• CVE-2016-8745

Apache Tomcat Deserialization of Untrusted Data Vulnerability

When using Apache Tomcat versions 10.0.0-M1 to 10.0.0-M4, 9.0.0.M1 to 9.0.34, 8.5.0 to 8.5.54 and 7.0.0 to 7.0.103 if a) an attacker is able to control the contents and name of a file on the server; and b) the server is configured to use the PersistenceManager with a FileStore; and c) the PersistenceManager is configured with sessionAttributeValueClassNameFilter="null" (the default unless a SecurityManager is used) or a sufficiently lax filter to allow the attacker provided object to be deserialized; and d) the attacker knows the relative file path from the storage location used by FileStore to the file the attacker has control over; then, using a specifically crafted request, the attacker will be able to trigger remote code execution via deserialization of the file under their control. Note that all of conditions a) to d) must be true for the attack to succeed.

Affected Versions

7.0.0 to 7.0.100

CVSS

CVSS:3.1/AV:L/AC:H/PR:L/UI:N/S:U/C:H/I:H/A:H

CVE-2018-8034

Apache Tomcat Improper Access Control Vulnerability

Apache Tomcat 7.x through 7.0.70 and 8.x through 8.5.4, when the CGI Servlet is enabled, follows RFC 3875 section 4.1.18 and therefore does not protect applications from the presence of untrusted client data in the HTTP_PROXY environment variable, which might allow remote attackers to redirect an application's outbound HTTP traffic to an arbitrary proxy server via a crafted Proxy header in an HTTP request, aka an "httpoxy" issue. NOTE: the vendor states "A mitigation is planned for future releases of Tomcat, tracked as CVE-2016-5388"; in other words, this is not a CVE ID for a vulnerability.

Affected Versions

7.0 to 7.0.70

CVE-2014-9634

Apache Tomcat Exposure of Sensitive Information to an Unauthorized Actor

When serving resources from a network location using the NTFS file system, Apache Tomcat versions 10.0.0-M1 to 10.0.0-M9, 9.0.0.M1 to 9.0.39, 8.5.0 to 8.5.59 and 7.0.0 to 7.0.106 were susceptible to JSP source code disclosure in some configurations. The root cause was the unexpected behavior of the JRE API File.getCanonicalPath() which in turn was caused by the inconsistent behavior of the Windows API (FindFirstFileW) in some circumstances.

Affected Versions

7.0.0 to 7.0.106

CVSS

CVSS:3.1/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:N/A:N

External References

CVE-2021-24122

Apache Tomcat Exposure of Sensitive Information to an Unauthorized Actor Vulnerability

When a SecurityManager is configured, a web application 's ability to read system properties should be controlled by the SecurityManager. In Apache Tomcat 9.0.0.M1 to 9.0.0.M9, 8.5.0 to 8.5.4, 8.0.0.RC1 to 8.0.36, 7.0.0 to 7.0.70, 6.0.0 to 6.0.45 the system property replacement feature for configuration files could be used by a malicious web application to bypass the SecurityManager and read system properties that should not be visible.

Affected Versions

7.0.52 to 7.0.70

CVSS:3.0/AV:N/AC:L/PR:N/UI:N/S:U/C:L/I:N/A:N

External References

CVE-2016-6794

Apache Tomcat Insufficient Information Vulnerability

The URL pattern of " " (the empty string) which exactly maps to the context root was not correctly handled in Apache Tomcat 9.0.0.M1 to 9.0.4, 8.5.0 to 8.5.27, 8.0.0.RC1 to 8.0.49 and 7.0.0 to 7.0.84 when used as part of a security constraint definition. This caused the constraint to be ignored. It was, therefore, possible for unauthorised users to gain access to web application resources that should have been protected. Only security constraints with a URL pattern of the empty string were affected.

Affected Versions

7.0.0 to 7.0.84

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:N/A:N

External References

CVE-2018-1304

Apache Tomcat Insufficient Information Vulnerability

Security constraints defined by annotations of Servlets in Apache Tomcat 9.0.0.M1 to 9.0.4, 8.5.0 to 8.5.27, 8.0.0.RC1 to 8.0.49 and 7.0.0 to 7.0.84 were only applied once a Servlet had been loaded. Because security constraints defined in this way apply to the URL pattern and any URLs below that point, it was possible - depending on the order Servlets were loaded - for some security constraints not to be applied. This could have exposed resources to users who were not authorised to access them.

Affected Versions

7.0.0 to 7.0.84

CVSS

CVSS:3.0/AV:N/AC:L/PR:L/UI:N/S:U/C:H/I:N/A:N

CVE-2018-11784

Apache Tomcat Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

The SSI printenv command in Apache Tomcat 9.0.0.M1 to 9.0.0.17, 8.5.0 to 8.5.39 and 7.0.0 to 7.0.93 echoes user provided data without escaping and is, therefore, vulnerable to XSS. SSI is disabled by default. The printenv command is intended for debugging

and is unlikely to be present in a production website.

Affected Versions

7.0.0 to 7.0.93

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:R/S:C/C:L/I:L/A:N

CVE-2019-0221

Apache Tomcat Permissions, Privileges, and Access Controls Vulnerability

The Realm implementations in Apache Tomcat versions 9.0.0.M1 to 9.0.0.M9, 8.5.0 to 8.5.4, 8.0.0.RC1 to 8.0.36, 7.0.0 to 7.0.70 and 6.0.0 to 6.0.45 did not process the supplied password if the supplied user name did not exist. This made a timing attack possible to determine valid user names. Note that the default configuration includes the LockOutRealm which makes exploitation of this vulnerability harder.

Affected Versions

7.0.52 to 7.0.70

CVSS

CVSS:3.0/AV:N/AC:H/PR:N/UI:N/S:U/C:H/I:N/A:N

Apache Tomcat Insufficient Verification of Data Authenticity Vulnerability

The CORS Filter in Apache Tomcat 9.0.0.M1 to 9.0.0.M21, 8.5.0 to 8.5.15, 8.0.0.RC1 to 8.0.44 and 7.0.41 to 7.0.78 did not add an HTTP Vary header indicating that the response varies depending on Origin. This permitted client and server side cache poisoning in some circumstances.

Affected Versions

7.0.52 to 7.0.78

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:R/S:U/C:N/I:L/A:N

External References

• CVE-2017-7674

Apache Tomcat Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') Vulnerability

In Apache Tomcat 9.0.0.M1 to 9.0.30, 8.5.0 to 8.5.50 and 7.0.0 to 7.0.99 the HTTP header parsing code used an approach to end-of-line parsing that allowed some invalid HTTP headers to be parsed as valid. This led to a possibility of HTTP Request Smuggling if Tomcat was located behind a reverse proxy that incorrectly handled the invalid Transfer-Encoding header in a particular manner. Such a reverse proxy is considered unlikely.

Affected Versions

7.0.0 to 7.0.99

4. [Possible] Expression Language Injection

Netsparker identified a possible expression language injection, which occurs when input data is evaluated by an expression language interpreter.

Even though Netsparker believes there is an expression language injection in here, it **could not confirm**it. There can be numerous reasons for Netsparker not being able to confirm it. We strongly recommend investigating the issue manually to ensure it is an expression language injection and needs to be addressed.

Impact

An attacker can read server-side data, such as the content of server-side variables, and some other inner configuration details. This is a quite dangerous vulnerability because developers assume their server-side code would not be read by anyone outside, so they may place sensitive information such as passwords, connection strings, database queries, etc. It can also be used for bypassing HttpOnly protection.

5. [Possible] Server-Side Request Forgery (Apache Server Status)

Netsparker detected a Server-Side Request Forgery based on pattern matching but was unable to confirm the vulnerability.

Impact

Server-Side Request Forgery allows an attacker to make local and/or remote network requests while masquerading as the target server.

Having an AWS meta-data API endpoint that is accessible through SSRF MAY lead to total compromise of the virtual computer and other AWS resources that are accessible by the compromised account.

6. [Probable] Local File Inclusion

Netsparker identified a probable Local File Inclusion vulnerability, which occurs when a file from the target system is injected into the attacked server page.

Even though Netsparker believes there is a high possibility of a local file inclusion in here, it **could not confirm**it. There can be numerous reasons for Netsparker being unable to confirm it. We strongly recommend you investigate the issue manually to ensure it is a local file inclusion and needs to be addressed. You can also consider sending us the details of this issue so we can address it the next time and give you more precise results.

Impact

Impact can differ based on the exploitation and the read permission of the web server user. Depending on these factors, an attacker might carry out one or more of the following attacks:

- Gather usernames via /etc/passwdfile
- Harvest useful information from the log files, such as /apache/logs/error.logor/apache/logs/access.log
- Remotely execute commands via combining this vulnerability with some of other attack vectors, such as file upload vulnerability or log injection

```

Remedy

- If possible, do not permit file paths to be appended directly. Make them hard-coded or selectable from a limited hard-coded path list via an index variable.
- If you definitely need dynamic path concatenation, ensure you only accept required characters such as "a-Z0-9" and do not allow ".." or "/" or "%00" (null byte) or any other similar unexpected characters.
- It's important to limit the API to allow inclusion only from a directory and directories below it. This ensures that any potential attack cannot perform a directory traversal attack.

7. Cross-site Scripting

Netsparker detected Cross-site Scripting, which allows an attacker to execute a dynamic script (*JavaScript*, *VBScript*) in the context of the application.

This allows several different attack opportunities, mostly hijacking the current session of the user or changing the look of the page by changing the HTML on the fly to steal the user's credentials. This happens because the input entered by a user has been interpreted as HTML/JavaScript/VBScript by the browser. Cross-site scripting targets the users of the application instead of the server. Although this is a limitation, since it allows attackers to hijack other users' sessions, an attacker might attack an administrator to gain full control over the application.

Impact

There are many different attacks that can be leveraged through the use of cross-site scripting, including:

- Hijacking user's active session.
- Mounting phishing attacks.
- Intercepting data and performing man-in-the-middle attacks.

\$(fu

var path = "/";

Additionally, you should implement a strong Content Security Policy (CSP) as a defense-in-depth measure if an XSS vulnerability is mistakenly introduced. Due to the complexity of XSS-Prevention and the lack of secure standard behavior in programming languages and frameworks, XSS vulnerabilities are still common in web applications.

CSP will act as a safeguard that can prevent an attacker from successfully exploiting Cross-site Scripting vulnerabilities in your website and is advised in any kind of application. Please make sure to scan your application again with Content Security Policy checks enabled after implementing CSP, in order to avoid common mistakes that can impact the effectiveness of your policy. There are a few pitfalls that can render your CSP policy useless and we highly recommend reading the resources linked in the reference section before you start to implement one.

Proof of Concept Notes

Generated XSS exploit might not work due to browser XSS filtering. Please follow the guidelines below in order to disable XSS filtering for different browsers. Also note that;

- XSS filtering is a feature that's enabled by default in some of the modern browsers. It should only be disabled temporarily to test exploits and should be reverted back if the browser is actively used other than testing purposes.
- Even though browsers have certain checks to prevent Cross-site scripting attacks in practice there are a variety of ways to bypass this mechanism therefore a web application should not rely on this kind of client-side browser checks.

Chrome

- · Open command prompt.
- Go to folder where chrome.exe is located.
- Run the command chrome.exe --args --disable-xss-auditor

Internet Explorer

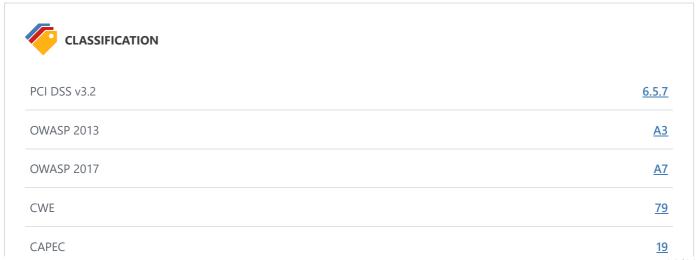

- Click Tools->Internet Options and then navigate to the Security Tab.
- Click Custom level and scroll towards the bottom where you will find that Enable XSS filter is currently Enabled.
- · Set it to disabled. Click OK.
- Click Yes to accept the warning followed by Apply.

Firefox

- Go to about: configin the URL address bar.
- In the search field, type urlbar.filterand find browser.urlbar.filter.javascript.
- Set its value to falseby double clicking the row.

Safari

- To disable the XSS Auditor, open Terminal and executing the command: defaults write com.apple.Safari "com.apple.Safari.ContentPageGroupIdentifier.WebKit2XSSAuditorEnabled" -bool FALSE
- Relaunch the browser and visit the PoC URL
- Please don't forget to enable XSS auditor again: defaults write com.apple.Safari
 "com.apple.Safari.ContentPageGroupIdentifier.WebKit2XSSAuditorEnabled" -bool TRUE

8. Cross-site Scripting via Remote File Inclusion

CONFIRMED 💄 1

Netsparker detected Cross-site Scripting via Remote File Inclusion, which makes it is possible to conduct cross-site scripting attacks by including arbitrary client-side dynamic scripts (*JavaScript*, *VBScript*).

Cross-site scripting allows an attacker to execute a dynamic script (*JavaScript*, *VBScript*) in the context of the application. This allows several different attack opportunities, mostly hijacking the current session of the user or changing the look of the page by changing the HTML on the fly to steal the user's credentials. This happens because the input entered by the user has been interpreted as HTML/JavaScript/VBScript by the browser.

Cross-site scripting targets the users of the application instead of the server. Although this is limitation, since it allows attackers to hijack other users' sessions, an attacker might attack an administrator to gain full control over the application.

Impact

There are many different attacks that can be leveraged through the use of cross-site scripting, including:

- Hijacking user's active session.
- Changing the look of the page within the victim's browser.
- Mounting a successful phishing attack.
- Intercepting data and performing man-in-the-middle attacks.

Remedy

The issue occurs because the browser interprets the input as active HTML, Javascript or VbScript. To avoid this, all input and output from the application should be filtered. Output should be filtered according to the output format and location. Typically, the output location is HTML. Where the output is HTML, ensure all active content is removed prior to its presentation to the server.

Additionally, you should implement a strong Content Security Policy (CSP) as a defence-in-depth measure if an XSS vulnerability is mistakenly introduced. Due to the complexity of XSS-Prevention and the lack of secure standard behavior in programming languages and frameworks, XSS vulnerabilities are still common in web applications.

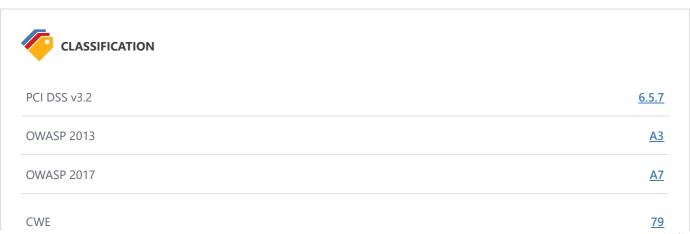

CSP will act as a safeguard that can prevent an attacker from successfully exploiting Cross Site Scripting vulnerabilities in your website and is advised in any kind of application. Please make sure to scan your application again with Content Security Policy checks enabled after implementing CSP, in order to avoid common mistakes that can impact the effectiveness of your policy. There are a few pitfalls that can render your CSP policy useless and we highly recommend reading the resources linked in the reference section before you start to implement one.

9. Insecure Transportation Security Protocol Supported (SSLv2)

HIGH P 1

CONFIRMED 💄 1

Netsparker detected that insecure transportation security protocol (SSLv2) is supported by your web server.

SSLv2 has several flaws. For example, your secure traffic can be observed when you have established it over SSLv2.

Impact

Attackers can perform man-in-the-middle attacks and observe the encryption traffic between your website and its visitors. Also an attacker can exploit vulnerabilities like DROWN.

Vulnerabilities

9.1. https://zero.webappsecurity.com/

CONFIRMED

Request

[SSL Connection]

Response

Response Time (ms): 1 Total Bytes Received: 16 Body Length: 0 Is Compressed: No

[SSL Connection]

Actions to Take

We recommended to disable SSLv2 and replace it with TLS 1.2 or higher. See Remedy section for more details.

Remedy

Configure your web server to disallow using weak ciphers.

• For Apache, you should modify the SSLProtocol directive in the httpd.conf.

SSLProtocol +TLSv1.2

For Nginx, locate any use of the directive ssl_protocols in the nginx.conffile and remove SSLv3.

ssl_protocols TLSv1.2;

- •
- For Microsoft IIS, you should make some changes on the system registry. **Incorrectly editing the registry may severely damage your system. Before making changes to the registry, you should back up any valued data on your computer.**
 - 1. Click Start, click Run, type regedt32 or type regedit, and then click OK.
 - 2. In Registry Editor, locate the following registry key:

 HKey_Local_Machine\System\CurrentControl\SecurityProviders\SCHANNEL\Protocols\SSL2\
 - 3. Locate a key named "Server." If it doesn't exist, create it.
 - 4. Under the "Server" key, locate a DWORD value named "Enabled." If it doesn't exist, create it and set it to "0".
- For lighttpd, put the following lines in your configuration file:

```
ssl.use-sslv2 = "disable"
ssl.use-sslv3 = "disable"
ssl.openssl.ssl-conf-cmd = ("Protocol" => "-TLSv1.1, -TLSv1, -SSLv3") # v1.4.48 or up
ssl.ec-curve = "secp384r1"
```

11. Apache Server-Status Detected

MEDIUM 🕑 1

Netsparker detected that Apache server-statusis enabled.

Information disclosed from this page can be used to gain additional information about the target system.

Impact

An attacker can gather reconnaissance information about the internals of the target web server, such as:

- Server uptime
- Individual request-response statistics and CPU usage of the working processes
- Current HTTP requests, client IP addresses, requested paths, and processed virtual hosts

This type of information can help the attacker gain a greater understanding of the system in use and the other potential avenues of attack available.

Vulnerabilities

11.1. http://zero.webappsecurity.com/server-status

Certainty

Request

GET /server-status HTTP/1.1

12. HTTP Strict Transport Security (HSTS) Policy Not Enabled

Netsparker identified that HTTP Strict Transport Security (HSTS) policy is not enabled.

The target website is being served from not only HTTPS but also HTTP and it lacks of HSTS policy implementation.

HTTP Strict Transport Security (HSTS) is a web security policy mechanism whereby a web server declares that complying user agents (such as a web browser) are to interact with it using only secure (HTTPS) connections. The HSTS Policy is communicated by the server to the user agent via a HTTP response header field named "Strict-Transport-Security". HSTS Policy specifies a period of time during which the user agent shall access the server in only secure fashion.

When a web application issues HSTS Policy to user agents, conformant user agents behave as follows:

- Automatically turn any insecure (HTTP) links referencing the web application into secure (HTTPS) links. (For instance, http://example.com/some/page/ will be modified to https://example.com/some/page/ before accessing the server.)
- If the security of the connection cannot be ensured (e.g. the server's TLS certificate is self-signed), user agents show an error message and do not allow the user to access the web application.

Vulnerabilities

13. Insecure Transportation Security Protocol **Supported (SSLv3)**

MEDIUM (P

CONFIRMED 💄

Netsparker detected that insecure transportation security protocol (SSLv3) is supported by your web server.

SSLv3 has several flaws. An attacker can cause connection failures and they can trigger the use of SSL 3.0 to exploit vulnerabilities like POODLE.

Impact

Attackers can perform man-in-the-middle attacks and observe the encryption traffic between your website and its visitors.

Vulnerabilities

13.1. https://zero.webappsecurity.com/

CONFIRMED

Request

[SSL Connection]

Response

Response Time (ms): 1 Total Bytes Received: 16 Body Length: 0 Is Compressed: No

[SSL Connection]

Actions to Take

We recommended to disable SSLv3 and replace it with TLS 1.2 or higher. See Remedy section for more details.

Remedy

Configure your web server to disallow using weak ciphers. You need to restart the web server to enable changes.

• For Apache, adjust the SSLProtocol directive provided by the mod_ssl module. This directive can be set either at the server level or in a virtual host configuration.

SSLProtocol +TLSv1.2

• For Nginx, locate any use of the directive ssl_protocols in the nginx.conffile and remove SSLv3.

```
ssl_protocols TLSv1.2;
```

- For Microsoft IIS, you should make some changes on the system registry. **Incorrectly editing the registry may severely damage your system. Before making changes to the registry, you should back up any valued data on your computer.**
 - 1. Click on Start and then Run, type regedt32or regedit, and then click OK.
 - 2. In Registry Editor, locate the following registry key or create if it does not exist:

 $\label{thm:local_machine} HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Security Providers\SCHANNEL\Protocols\SSL 3.0\$

- 3. Locate a key named Serveror create if it doesn't exist.
- 4. Under the Serverkey, locate a DWORD value named Enabledor create if it doesn't exist and set its value to "0".
- For lighttpd, put the following lines in your configuration file:

```
ssl.use-sslv2 = "disable"
ssl.use-sslv3 = "disable"
ssl.openssl.ssl-conf-cmd = ("Protocol" => "-TLSv1.1, -TLSv1, -SSLv3") # v1.4.48 or up
ssl.ec-curve = "secp384r1"
```

14. Out-of-date Version (jQuery)

Netsparker identified the target web site is using jQuery and detected that it is out of date.

Impact

Since this is an old version of the software, it may be vulnerable to attacks.

| jQuery Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

jQuery before 3.0.0 is vulnerable to Cross-site Scripting (XSS) attacks when a cross-domain Ajax request is performed without the dataType option, causing text/javascript responses to be executed.

Affected Versions

1.8.0 to 2.2.4

CVSS

CVSS:3.0/AV:N/AC:L/PR:N/UI:R/S:C/C:L/I:L/A:N

External References

• CVE-2015-9251

JQuery Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') Vulnerability

jQuery before 1.9.0 is vulnerable to Cross-site Scripting (XSS) attacks. The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Affected Versions

1.8.0 to 1.8.3

CVSS

- TLS_DHE_RSA_WITH_3DES_EDE_CBC_SHA (0x0016)
- TLS_RSA_WITH_AES_128_CBC_SHA (0x002F)
- TLS_DHE_RSA_WITH_AES_128_CBC_SHA (0x0033)
- TLS_RSA_WITH_AES_256_CBC_SHA (0x0035)
- TLS_DHE_RSA_WITH_AES_256_CBC_SHA (0x0039)

Request

[SSL Connection]

Response

Response Time (ms): 1 Total Bytes Received: 16 Body Length: 0 Is Compressed: No

[SSL Connection]

Actions to Take

1. For Apache, you should modify the SSLCipherSuite directive in the httpd.conf.

```
SSLCipherSuite HIGH:MEDIUM:!MD5:!RC4
```

2. Lighttpd:

```
ssl.honor-cipher-order = "enable"
ssl.cipher-list = "EECDH+AESGCM:EDH+AESGCM"
```

3. For Microsoft IIS, you should make some changes to the system registry. **Incorrectly editing the registry may severely** damage your system. Before making changes to the registry, you should back up any valued data on your computer.

a.Click Start, click Run, type regedt32or type regedit, and then click OK.

b.In Registry Editor, locate the following registry key: HKLM\SYSTEM\CurrentControlSet\Control\SecurityProviders **c.**Set "Enabled" DWORD to "0x0" for the following registry keys:

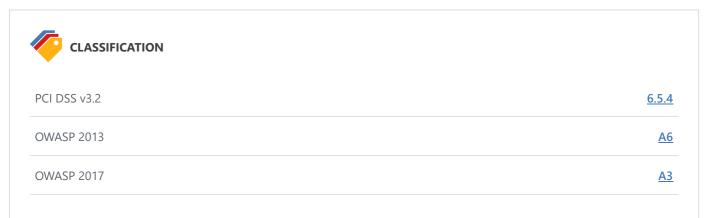

```
SCHANNEL\Ciphers\DES 56/56
SCHANNEL\Ciphers\RC4 64/128
SCHANNEL\Ciphers\RC4 40/128
SCHANNEL\Ciphers\RC2 56/128
SCHANNEL\Ciphers\RC2 40/128
SCHANNEL\Ciphers\NULL
SCHANNEL\Hashes\MD5
```

Remedy

Configure your web server to disallow using weak ciphers.

16. [Possible] Cross-site Request Forgery

Netsparker identified a possible Cross-Site Request Forgery.

CSRF is a very common vulnerability. It's an attack which forces a user to execute unwanted actions on a web application in which the user is currently authenticated.

Impact

Depending on the application, an attacker can mount any of the actions that can be done by the user such as adding a user, modifying content, deleting data. All the functionality that's available to the victim can be used by the attacker. Only exception to this rule is a page that requires extra information that only the legitimate user can know (such as user's password).

Vulnerabilities

16.1. http://zero.webappsecurity.com/feedback.html

Form Action(s)

/sendFeedback.html

Certainty

Request

GET /feedback.html HTTP/1.1
Host: zero.webappsecurity.com

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,image/apng,*/*;q=0.8

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

Referer: http://zero.webappsecurity.com/

Upgrade-Insecure-Requests: 1

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

45.0 Safari/537.36

Response

```

<hr class="wide"/>
<form action="/sendFeedback.html"method="post" class="">
<div class="signin-controls form-inputs">
<div class="control-group">
<div class="controls pictured">
```

Remedy

- Send additional information in each HTTP request that can be used to determine whether the request came from an authorized source. This "validation token" should be hard to guess for attacker who does not already have access to the user's account. If a request is missing a validation token or the token does not match the expected value, the server should reject the request.
- If you are posting form in ajax request, custom HTTP headers can be used to prevent CSRF because the browser prevents
 sites from sending custom HTTP headers to another site but allows sites to send custom HTTP headers to themselves using
 XMLHttpRequest.
 - For native XMLHttpRequest (XHR) object in JavaScript;

```
xhr = new XMLHttpRequest();
xhr.setRequestHeader('custom-header', 'valueNULL');
```

For JQuery, if you want to add a custom header (or set of headers) to a. **individual request**

```
$.ajax({
    url: 'foo/bar',
```

```
headers: { 'x-my-custom-header': 'some value' }
});
```

b. every request

```
$.ajaxSetup({
    headers: { 'x-my-custom-header': 'some value' }
});
OR
$.ajaxSetup({
    beforeSend: function(xhr) {
        xhr.setRequestHeader('x-my-custom-header', 'some value');
    }
});
```

17. [Possible] Cross-site Request Forgery in Login Form

Netsparker identified a possible Cross-Site Request Forgery in Login Form.

In a login CSRF attack, the attacker forges a login request to an honest site using the attacker's user name and password at that site. If the forgery succeeds, the honest server responds with a Set-Cookie header that instructs the browser to mutate its state by storing a session cookie, logging the user into the honest site as the attacker. This session cookie is used to bind subsequent requests to the user's session and hence to the attacker's authentication credentials. The attacker can later log into the site with his legitimate credentials and view private information like activity history that has been saved in the account.

Impact

In this particular case CSRF affects the login form in which the impact of this vulnerability is decreased significantly. Unlike normal CSRF vulnerabilities this will only allow an attacker to exploit some complex XSS vulnerabilities otherwise it can't be exploited.

For example;

If there is a page that's different for every user (such as "edit my profile") and vulnerable to XSS (Cross-site Scripting) then normally it cannot be exploited. However if the login form is vulnerable, an attacker can prepare a special profile, force victim to login as that user which will trigger the XSS exploit. Again attacker is still quite limited with this XSS as there is no active session. However the attacker can leverage this XSS in many ways such as showing the same login form again but this time capturing and sending the entered username/password to the attacker.

In this kind of attack, attacker will send a link containing html as simple as the following in which attacker's user name and password is attached.

When the victim clicks the link then form will be submitted automatically to the honest site and exploitation is successful, victim will be logged in as the attacker and consequences will depend on the website behavior.

Search History

Many sites allow their users to opt-in to saving their search history and provide an interface for a user to review his or her personal search history. Search queries contain sensitive details about the user's interests and activities and could be used by the attacker to embarrass the user, to steal the user's identity, or to spy on the user. Since the victim logs in as the attacker, the victim's search queries are then stored in the attacker's search history, and the attacker can retrieve the queries by logging into his or her own account.

Shopping

Merchant sites might save the credit card details in user's profile. In login CSRF attack, when user funds a purchase and enrolls the credit card, the credit card details might be added to the attacker's account.

Vulnerabilities

Form Action(s)

• /signin.html

Certainty

```

Remedy

- Send additional information in each HTTP request that can be used to determine whether the request came from an authorized source. This "validation token" should be hard to guess for attacker who does not already have access to the user's account. If a request is missing a validation token or the token does not match the expected value, the server should reject the request.
- If you are posting form in ajax request, custom HTTP headers can be used to prevent CSRF because the browser prevents sites from sending custom HTTP headers to another site but allows sites to send custom HTTP headers to themselves using XMLHttpRequest.
 - For native XMLHttpRequest (XHR) object in JavaScript;

```
xhr = new XMLHttpRequest();
xhr.setRequestHeader('custom-header', 'valueNULL);
```

For JQuery, if you want to add a custom header (or set of headers) to

a. individual request

```
$.ajax({
    url: 'foo/bar',
    headers: { 'x-my-custom-header': 'some value' }
});
```

b. every request

```
$.ajaxSetup({
    headers: { 'x-my-custom-header': 'some value' }
});
OR
$.ajaxSetup({
    beforeSend: function(xhr) {
        xhr.setRequestHeader('x-my-custom-header', 'some value');
    }
});
```

18. [Possible] Phishing by Navigating Browser Tabs

Netsparker identified possible phishing by navigating browser tabs but was unable to confirm the vulnerability.

Open windows with normal hrefs with the tag target="_blank"can modify window.opener.location and replace the parent webpage with something else, even on a different origin.

Impact

While this vulnerability doesn't allow script execution, it does allow phishing attacks that silently replace the parent tab. If the links lack rel="noopener noreferrer" attribute, a third party site can change the URL of the source tab using window.opener.location.assignand trick the users into thinking that they're still in a trusted page and lead them to enter their sensitive data on the malicious website.

Vulnerabilities

$.each(footerLinks, function(linkId, link) {
attachClickH
```

Remedy

- Add rel=noopener to the linksto prevent pages from abusing window.opener. This ensures that the page cannot access the window.opener property in Chrome and Opera browsers.
- For older browsers and in Firefox, you can add rel=noreferrerwhich additionally disables the Referer header.

```
<a href="..." target="_blank" rel="noopener noreferrer">...</a>
```

19. Insecure Transportation Security Protocol Supported (TLS 1.0)

LOW 🕒 1

CONFIRMED 💄 1

Netsparker detected that insecure transportation security protocol (TLS 1.0) is supported by your web server.

TLS 1.0 has several flaws. An attacker can cause connection failures and they can trigger the use of TLS 1.0 to exploit vulnerabilities like BEAST (Browser Exploit Against SSL/TLS).

Websites using TLS 1.0 are considered non-compliant by PCI since 30 June 2018.

Impact

Attackers can perform man-in-the-middle attacks and observe the encryption traffic between your website and its visitors.

Vulnerabilities

19.1. https://zero.webappsecurity.com/

CONFIRMED

Request

[SSL Connection]

Response

Response Time (ms): 1 Total Bytes Received: 16 Body Length: 0 Is Compressed: No

[SSL Connection]

Actions to Take

We recommended to disable TLS 1.0 and replace it with TLS 1.2 or higher. See Remedy section for more details.

Remedy

Configure your web server to disallow using weak ciphers. You need to restart the web server to enable changes.

• For Apache, adjust the SSLProtocol directive provided by the mod_ssl module. This directive can be set either at the server level or in a virtual host configuration.

SSLProtocol +TLSv1.2

• For Nginx, locate any use of the directive ssl_protocols in the nginx.conffile and remove TLSv1.

```
ssl_protocols TLSv1.2;
```

- For Microsoft IIS, you should make some changes on the system registry. Incorrectly editing the registry may severely damage your system. Before making changes to the registry, you should back up any valued data on your computer.
 - 1. Click on Start and then Run, type regedt32or regedit, and then click OK.
 - 2. In Registry Editor, locate the following registry key or create if it does not exist:

 $\label{thm:local_machine} HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Control\Security Providers\SCHANNEL\Protocols\TLS~1.0\$

- 3. Locate a key named Serveror create if it doesn't exist.
- 4. Under the Serverkey, locate a DWORD value named Enabledor create if it doesn't exist and set its value to "0".
- For lighttpd, put the following lines in your configuration file:

```
ssl.use-sslv2 = "disable"
ssl.use-sslv3 = "disable"
ssl.openssl.ssl-conf-cmd = ("Protocol" => "-TLSv1.1, -TLSv1, -SSLv3") # v1.4.48 or up
ssl.ec-curve = "secp384r1"
```

20. Misconfigured Access-Control-Allow-Origin Header

Netsparker detected a possibly misconfigured Access-Control-Allow-Origin header in resource's HTTP response.

Cross-origin resource sharing (CORS) is a mechanism that allows resources on a web page to be requested outside the domain through XMLHttpRequest.

Unless this HTTP header is present, such "cross-domain" requests are forbidden by web browsers, per the same-origin security policy.

Impact

This is generally not appropriate when using the same-origin security policy. The only case where this is appropriate when using the same-origin policy is when a page or API response is considered completely public content and it is intended to be accessible to everyone.

Vulnerabilities

20.1. http://zero.webappsecurity.com/

Access-Control-Allow-Origin

•

Certainty

<!DOCTYPE html>
<html lang="en">
<head>
<meta charset="utf-</pre>
```

Remedy

If this page is intended to be accessible to everyone, you don't need to take any action. Otherwise please follow the guidelines for different architectures below in order to set this header and permit outside domain.

Apache

• Add the following line inside either the <directory>, <location>, <files> or <virtualhost> sections of your server config (usually located in httpd.confor apache.conf), or within a .htaccessfile.

```
Header set Access-Control-Allow-Origin "domain"
```

IIS6

- 1. Open Internet Information Service (IIS) Manager
- 2. Right click the site you want to enable CORS for and go to Properties
- 3. Change to the HTTP Headers tab
- 4. In the Custom HTTP headers section, click Add
- 5. Enter Access-Control-Allow-Origin as the header name
- 6. Enter domainas the header value

IIS7

• Merge the following xml into the web.config file at the root of your application or site:

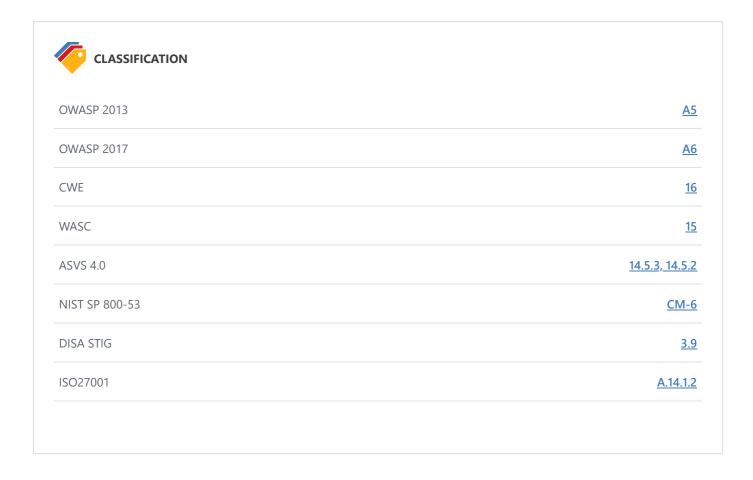

ASP.NET

• If you don't have access to configure IIS, you can still add the header through ASP.NET by adding the following line to your source pages:

```
Response.AppendHeader("Access-Control-Allow-Origin", "domain");
```

External References

- Cross-Origin Resource Sharing
- HTTP access control (CORS)
- <u>Using CORS</u>

21. Missing X-Frame-Options Header

Netsparker detected a missing X-Frame-Optionsheader which means that this website could be at risk of a clickjacking attack.

The X-Frame-OptionsHTTP header field indicates a policy that specifies whether the browser should render the transmitted resource within a frameor an iframe. Servers can declare this policy in the header of their HTTP responses to prevent clickjacking attacks, which ensures that their content is not embedded into other pages or frames.

Impact

Clickjacking is when an attacker uses multiple transparent or opaque layers to trick a user into clicking on a button or link on a framed page when they were intending to click on the top level page. Thus, the attacker is "hijacking" clicks meant for their page and routing them to other another page, most likely owned by another application, domain, or both.

Using a similar technique, keystrokes can also be hijacked. With a carefully crafted combination of stylesheets, iframes, and text boxes, a user can be led to believe they are typing in the password to their email or bank account, but are instead typing into an invisible frame controlled by the attacker.

Remedy

- Sending the proper X-Frame-Options in HTTP response headers that instruct the browser to not allow framing from other domains.
 - X-Frame-Options: DENYIt completely denies to be loaded in frame/iframe.
 - X-Frame-Options: SAMEORIGINIt allows only if the site which wants to load has a same origin.
 - X-Frame-Options: ALLOW-FROM *URL*It grants a specific URL to load itself in a iframe. However please pay attention to that, not all browsers support this.
- Employing defensive code in the UI to ensure that the current frame is the most top level window.

28. Content Security Policy (CSP) Not Implemented

BEST PRACTICE 🖞 1

CSP is an added layer of security that helps to mitigate mainly Cross-site Scripting attacks.

CSP can be enabled instructing the browser with a Content-Security-Policy directive in a response header;

```
Content-Security-Policy: script-src 'self';
or in a meta tag;
```

```
<meta http-equiv="Content-Security-Policy" content="script-src 'self';">
```

In the above example, you can restrict script loading only to the same domain. It will also restrict inline script executions both in the element attributes and the event handlers. There are various directives which you can use by declaring CSP:

- script-src:Restricts the script loading resources to the ones you declared. By default, it disables inline script executions
 unless you permit to the evaluation functions and inline scripts by the unsafe-eval and unsafe-inline keywords.
- **base-uri:**The base element is used to resolve a relative URL to an absolute one. By using this CSP directive, you can define all possible URLs which could be assigned to the base-href attribute of the document.
- **frame-ancestors**: It is very similar to X-Frame-Options HTTP header. It defines the URLs by which the page can be loaded in an iframe.
- **frame-src / child-src**: frame-src is the deprecated version of child-src. Both define the sources that can be loaded by iframe on the page. (Please note that frame-src was brought back in CSP 3)
- object-src: Defines the resources that can be loaded by embedding such as Flash files, Java Applets.
- img-src: As its name implies, it defines the resources where the images can be loaded from.
- connect-src: Defines the whitelisted targets for XMLHttpRequest and WebSocket objects.
- **default-src**: It is a fallback for the directives that mostly end with -src suffix. When the directives below are not defined, the value set to default-src will be used instead:
 - o child-src
 - o connect-src
 - o font-src
 - img-src
 - manifest-src
 - o media-src
 - object-src
 - o script-src
 - o style-src

When setting the CSP directives, you can also use some CSP keywords:

- **none**: Denies loading resources from anywhere.
- **self**: Points to the document's URL (domain + port).
- unsafe-inline: Permits running inline scripts.
- unsafe-eval: Permits execution of evaluation functions such as eval().

In addition to CSP keywords, you can also use wildcard or only a scheme when defining whitelist URLs for the points. Wildcard can be used for subdomain and port portions of the URLs:

```
Content-Security-Policy: script-src <a href="https://*.example.com">https://*.example.com</a>;
Content-Security-Policy: script-src <a href="https://example.com">https://example.com</a>;
Content-Security-Policy: script-src <a href="https://example.com">https://example.com</a>;
```

It is also possible to set a CSP in Report-Only mode instead of forcing it immediately in the migration period. Thus you can see the violations of the CSP policy in the current state of your web site while migrating to CSP:

```
Content-Security-Policy-Report-Only: script-src 'self'; report-uri: <a href="https://example.com">https://example.com</a>;
```

Impact

There is no direct impact of not implementing CSP on your website. However, if your website is vulnerable to a Cross-site Scripting attack CSP can prevent successful exploitation of that vulnerability. By not implementing CSP you'll be missing out on this extra layer of security.

Vulnerabilities

28.1. http://zero.webappsecurity.com/

Certainty

```

Actions to Take

- Enable CSP on your website by sending the Content-Security-Policyin HTTP response headers that instruct the browser to apply the policies you specified.
- Apply the whitelist and policies as strict as possible.
- Rescan your application to see if Netsparker identifies any weaknesses in your policies.

Remedy

Enable CSP on your website by sending the Content-Security-Policyin HTTP response headers that instruct the browser to apply the policies you specified.

<u>3.5.1</u>
A.14.2.5

29. Expect-CT Not Enabled

BEST PRACTICE 🖞 1

Netsparker identified that Expect-CT is not enabled.

Certificate Transparency is a technology that makes impossible (or at least very difficult) for a CA to issue an SSL certificate for a domain without the certificate being visible to the owner of that domain.

Google announced that, starting with April 2018, if it runs into a certificate that is not seen in Certificate Transparency (CT) Log, it will consider that certificate invalid and reject the connection. Thus sites should serve certificate that takes place in CT Logs. While handshaking, sites should serve a valid Signed Certificate Timestamp (SCT) along with the certificate itself.

Expect-CT can also be used for detecting the compatibility of the certificates that are issued before the April 2018 deadline. For instance, a certificate that was signed before April 2018, for 10 years it will be still posing a risk and can be ignored by the certificate transparency policy of the browser. By setting Expect-CT header, you can prevent misissused certificates to be used.

Vulnerabilities

29.1. https://zero.webappsecurity.com/

Certainty

Request

GET / HTTP/1.1

Host: zero.webappsecurity.com

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,image/apng,*/*;q=0.8

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

Referer: https://zero.webappsecurity.com/

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

Response Time (ms): 245.9713 Total Bytes Received: 345 Body Length: 44 Is Compressed: No

HTTP/1.1 200 OK

Content-Type: text/html

Server: Apache/2.2.6 (Win32) mod_ssl/2.2.6 OpenSSL/0.9.8e mod_jk/1.2.40

Content-Length: 44

Last-Modified: Sat, 20 Nov 2004 14:16:24 GMT

Accept-Ranges: bytes

Access-Control-Allow-Origin: *
Date: Wed, 14 Jul 2021 10:08:36 GMT

ETag: "24c22-2c-44adde00"

<html><body><h1>It works!</h1></body></html>

Remedy

Configure your web server to respond with Expect-CT header.

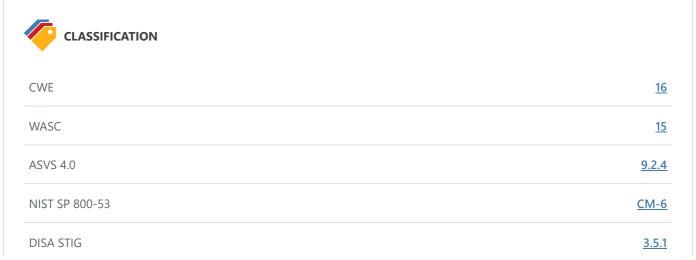

```
Expect-CT: enforce, max-age=7776000, report-uri="https://ABSOLUTE REPORT URL"
```

Note: We strongly suggest you to use Expect-CT header in **report-only mode**first. If everything goes well and your certificate is ready, go with the Expect-CT enforcemode. To use **report-only mode**first, omit **enforce**flag and see the browser's behavior with your deployed certificate.

```
Expect-CT: max-age=7776000, report-uri="https://ABSOLUTE_REPORT_URL"
```

30. Missing X-XSS-Protection Header

BEST PRACTICE 🖞 1

Netsparker detected a missing X-XSS-Protectionheader which means that this website could be at risk of a Cross-site Scripting (XSS) attacks.

Impact

This issue is reported as additional information only. There is no direct impact arising from this issue.

Vulnerabilities

30.1. http://zero.webappsecurity.com/

Certainty

Request

GET / HTTP/1.1

Host: zero.webappsecurity.com

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,image/apng,*/*;q=0.8

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

```
Response Time (ms): 859.3848 Total Bytes Received: 12741 Body Length: 12471 Is Compressed: No
```

```
HTTP/1.1 200 OK
Content-Type: text/html;charset=UTF-8
Server: Apache-Coyote/1.1
Content-Language: en-US
Access-Control-Allow-Origin: *
Transfer-Encoding: chunked
Date: Wed, 14 Jul 2021 10:08:12 GMT
Cache-Control: no-cache, max-age=0, must-revalidate, no-store
<!DOCTYPE html>
<html lang="en">
<head>
<meta charset="utf-8">
<title>Zero - Personal Banking - Loans - Credit Cards</title>
<meta name="viewport" content="width=device-width, initial-scale=1.0, maximum-scale=1.0, user-scalab</pre>
le=no">
<meta http-equiv="X-UA-Compatible" content="IE=Edge">
<link type="text/css" rel="stylesheet" href="/resources/css/bootstrap.min.css"/>
<link type="text/css" rel="stylesheet" href="/resources/css/font-awesome.css"/>
<link type="text/css" rel="stylesheet" href="/resources/css/main.css"/>
<script src="/resources/js/jquery-1.8.2.min.js"></script>
<script src="/resources/js/bootstrap.min.js"></script>
<script src="/resources/js/placeholders.min.js"></script>
<script type="text/javascript">
Placeholders.init({
live: true, // Apply to future and modified elements too
hideOnFocus: true // Hide the placeholder when the element receives focus
});
</script>
<script type="text/javascript">
$(document).ajaxError(function errorHandler(event, xhr, ajaxOptions, thrownError) {
if (xhr.status == 403) {
window.location.reload();
}
});
</script>
</head>
<body>
<div class="wrapper">
<div class="navbar navbar-fixed-top">
<div class="navbar-inner">
<div class="container">
<a href="/index.html" class="brand">Zero Bank</a>
<div>
<form action="/search.html"</li>
```

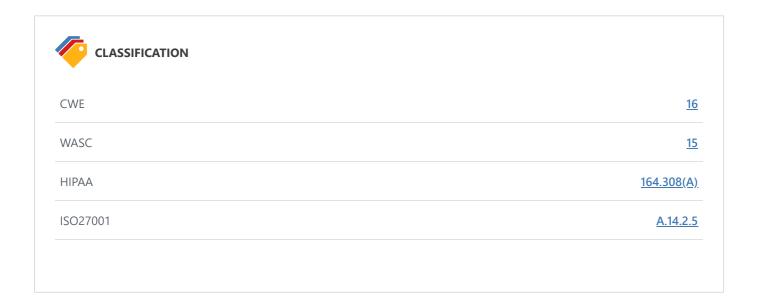

Remedy

Add the X-XSS-Protection header with a value of "1; mode= block".

• X-XSS-Protection: 1; mode=block

31. Referrer-Policy Not Implemented

BEST PRACTICE 🖞 1

Netsparker detected that no Referrer-Policy header implemented.

Referrer-Policy is a security header designed to prevent cross-domain Referer leakage.

Impact

Referer header is a request header that indicates the site which the traffic originated from. If there is no adequate prevention in place, the URL itself, and even sensitive information contained in the URL will be leaked to the cross-site.

The lack of Referrer-Policy header might affect privacy of the users and site's itself

Vulnerabilities

31.1. http://zero.webappsecurity.com/

Certainty

Request

GET / HTTP/1.1

Host: zero.webappsecurity.com

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,image/apng,*/*;q=0.8

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

```
Response Time (ms): 859.3848 Total Bytes Received: 12741 Body Length: 12471 Is Compressed: No
```

```
HTTP/1.1 200 OK
Content-Type: text/html;charset=UTF-8
Server: Apache-Coyote/1.1
Content-Language: en-US
Access-Control-Allow-Origin: *
Transfer-Encoding: chunked
Date: Wed, 14 Jul 2021 10:08:12 GMT
Cache-Control: no-cache, max-age=0, must-revalidate, no-store
<!DOCTYPE html>
<html lang="en">
<head>
<meta charset="utf-8">
<title>Zero - Personal Banking - Loans - Credit Cards</title>
<meta name="viewport" content="width=device-width, initial-scale=1.0, maximum-scale=1.0, user-scalab</pre>
le=no">
<meta http-equiv="X-UA-Compatible" content="IE=Edge">
<link type="text/css" rel="stylesheet" href="/resources/css/bootstrap.min.css"/>
<link type="text/css" rel="stylesheet" href="/resources/css/font-awesome.css"/>
<link type="text/css" rel="stylesheet" href="/resources/css/main.css"/>
<script src="/resources/js/jquery-1.8.2.min.js"></script>
<script src="/resources/js/bootstrap.min.js"></script>
<script src="/resources/js/placeholders.min.js"></script>
<script type="text/javascript">
Placeholders.init({
live: true, // Apply to future and modified elements too
hideOnFocus: true // Hide the placeholder when the element receives focus
});
</script>
<script type="text/javascript">
$(document).ajaxError(function errorHandler(event, xhr, ajaxOptions, thrownError) {
if (xhr.status == 403) {
window.location.reload();
}
});
</script>
</head>
<body>
<div class="wrapper">
<div class="navbar navbar-fixed-top">
<div class="navbar-inner">
<div class="container">
<a href="/index.html" class="brand">Zero Bank</a>
<div>
<form action="/search.html"</li>
```

Actions to Take

In a response header:

```
Referrer-Policy: no-referrer | same-origin | origin | strict-origin | no-origin-when-downgrading
```

In a META tag

```
<meta name="Referrer-Policy" value="no-referrer | same-origin"/>
```

In an element attribute

```
<a href="http://crosssite.example.com" rel="noreferrer"></a>
```

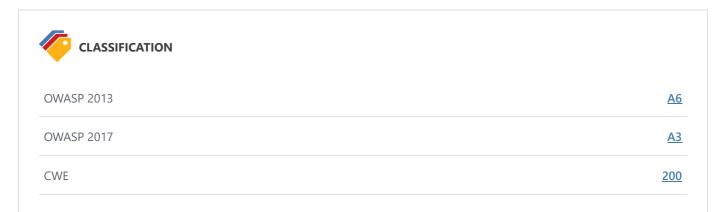

or

Remedy

Please implement a Referrer-Policy by using the Referrer-Policy response header or by declaring it in the meta tags. It's also possible to control referrer information over an HTML-element by using the rel attribute.

32. SameSite Cookie Not Implemented

BEST PRACTICE P 1

Cookies are typically sent to third parties in cross origin requests. This can be abused to do CSRF attacks. Recently a new cookie attribute named *SameSitewas* proposed to disable third-party usage for some cookies, to prevent CSRF attacks.

Same-site cookies allow servers to mitigate the risk of CSRF and information leakage attacks by asserting that a particular cookie should only be sent with requests initiated from the same registrable domain.

Vulnerabilities

32.1. http://zero.webappsecurity.com/signin.html

Identified Cookie(s)

JSESSIONID

Cookie Source

HTTP Header

Certainty

Request

GET /signin.html HTTP/1.1
Host: zero.webappsecurity.com

 $Accept: \ text/html, application/xhtml+xml, application/xml; q=0.9, image/webp, image/apng, */*; q=0.8, image/webp, image/we$

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

Referer: http://zero.webappsecurity.com/login.html

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

Response Time (ms): 263.4397 Total Bytes Received: 316 Body Length: 0 Is Compressed: No

HTTP/1.1 302 Found

Set-Cookie: JSESSIONID=9D2B50BA; Path=/; HttpOnly

Content-Type: text/html
Server: Apache-Coyote/1.1

Content-Length: 0

Access-Control-Allow-Origin: *

Location: /login.html?login_error=true Date: Wed, 14 Jul 2021 10:08:47 GMT

Cache-Control: no-cache, max-age=0, must-revalidate, no-store

Remedy

The server can set a same-site cookie by adding the SameSite=...attribute to the Set-Cookieheader. There are three possible values for the SameSiteattribute:

• Lax:In this mode, the cookie will only be sent with a top-level get request.

Set-Cookie: key=value; SameSite=Lax

• Strict: In this mode, the cookie will not be sent with any cross-site usage even if the user follows a link to another website.

Set-Cookie: key=value; SameSite=Strict

• None: In this mode, the cookie will be sent with the cross-site requests. Cookies with SameSite=Nonemust also specify the Secureattribute to transfer them via a secure context. Setting a SameSite=Nonecookie without the Secureattribute will be rejected by the browsers.

Set-Cookie: key=value; SameSite=None; Secure

39. Email Address Disclosure

INFORMATION (1)

Netsparker identified an Email Address Disclosure.

Impact

Email addresses discovered within the application can be used by both spam email engines and also brute-force tools. Furthermore, valid email addresses may lead to social engineering attacks.

Vulnerabilities

39.1. http://zero.webappsecurity.com/resources/css/font-awesome.css

Email Address(es)

• dave@davegandy.com

Certainty

Request

GET /resources/css/font-awesome.css HTTP/1.1

Host: zero.webappsecurity.com

Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,image/appg,*/*;q=0.8

Accept-Encoding: gzip, deflate Accept-Language: en-us,en;q=0.5

Cache-Control: no-cache

Referer: http://zero.webappsecurity.com/

User-Agent: Mozilla/5.0 (Windows NT 10.0; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/79.0.39

```
Response Time (ms): 218.5981 Total Bytes Received: 22118 Body Length: 21752 Is Compressed: No
```

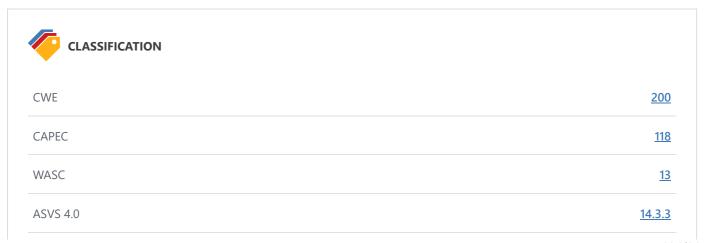

```
HTTP/1.1 200 OK
Content-Type: text/css;charset=UTF-8

@font-face {
font-family: 'FontAwesome';
src: url('../font/fontawesome-webfont.eot?v=3.0.1
```

Remedy

Use generic email addresses such as contact@ or info@ for general communications and remove user/people-specific email addresses from the website; should this be required, use submission forms for this purpose.

40. Forbidden Resource

Netsparker identified a forbidden resource.

Access to this resource has been denied by the web server. This is generally not a security issue, and is reported here for informational purposes.

Impact

This issue is reported as additional information only. There is no direct impact arising from this issue.

Vulnerabilities

40.1. http://zero.webappsecurity.com/cgi-bin/

CONFIRMED

Request

GET /cgi-bin/ HTTP/1.1
